Task 1

Below, I have used two user that is bob and mdti.

mdti@virtual-ubuntu-server: /home

```
mdti@virtual-ubuntu-server:/home$ ls
bob mdti ubuntu
mdti@virtual-ubuntu-server:/home$
```

Command for add user is: sudo useradd -m -u userid -s /bin/bash username

Comment: -m create home directory and -u sets default shell to bash and set specific userid number.

For the personal username:

We must copy the already existing .ssh/authorized_keys file for the new user.

Command:

- \$ cd username
- \$ sudo cp -p -r ~ubuntu/.ssh
- \$ sudo chown -R username:username .ssh (have to change user name)

To add superuser privileges:

we can copy peste below code. Just have to change user name.

- \$ Sudo -i
- # cd /etc/sudoers.d/
- # cp -p 90-cloud-init-users 91-stec-users
- # vi file

Here we have to replace default username.

Task 2

Adding new user that's name is bob:

sudo useradd -m -u 1622 -s /bin/bash bob

Command:

```
$ sudo -i
```

```
# cd ~bod
# mkdir .ssh
# touch .ssh/authorized_keys
# chown -R bob:bob .ssh
# chmod 600 .ssh/authorized keys
```

For the other user:

Today, Date: 4/30/2021. In my group there is three people. Still, they didn't add their username.

That's why I couldn't add their userid and name. Sorry for that.

Task 3

```
SSH key add for user:
# cd ~bob
# vi .ssh/authorized_keys
# cat .ssh/authorized_keys
Put id public in the file.
```

ssh-rsa

Task 4

Tips added.

Here we just crated a file linuxtips.sh in my server and one tips folder and included 10 tips.

For showing it every terminal opening session. We just add sh linuxtips.sh in .bashrc file.

Task 5

Documentation updated.
